ZAPISNIK
o primopredaji nulte linije

Dana 07.09.2022. godine načelnica općine Hrvatska Dubica Ružica Karagić dipl. oec. kao predstavnik investitora, te predstavnik projektanta Darko Tominić dipl. ing. šum. obišli su konačnu, odabranu nultu liniju kojom je započela faza projektiranja rekonstrukcije traktorskog puta u šumsku cestu "Rimska cesta – dionica I" u gospodarskoj jedinici privatnih šuma "Dubičke šume".

Obilaskom i kontrolom nulte linije utvrđuje se slijedeće:

- položaj nulte linije se dobro uklapa u idejnu trasu, nulta linija je na terenu propisano obilježena kao točka predstavljena malim kolčićem do vrha zabijenim u tlo obojen crvenom bojom za obilježavanje drva, te je napisan redni broj lomne točke na veći kolac pored njega
- nagib nulte linije je u granicama propisanim tehničkim značajkama šumskih cesta za brdsko – planinsko područje (*Tehnički uvijeti za gospodarske ceste, Šikić i ostali 1989.*), koji iznosi manje ili jednako od maksimalno dozvoljenih 15 % u uzdužnom nagibu
- u suglasnosti s predstavnikom investitora Daliborom Bišćanom mag. ing. amb. obavljene su od strane projektanta manje korekcije nulte linije na samom terenu
- korigirana nulta linija je u svom konačnom obliku prihvaćena i od strane investitora i od strane projektanta kao polazna osnova za uklapanje osovinskog poligona i provedbu daljeg tijeka postupka projektiranja

8. Proračun mehaničke otpornosti i stabilnosti građevine

ZEMLJANI RADOVI

Tijekom izvođenja zemljanih radova izvođač je dužan obavljati kontrolu mjera i nagiba, evidenciju kategorija materijala u iskopima, a dokaze o ispravnosti treba podnijeti nadzornom inženjeru. Sve gotove površine moraju biti izvedene prema projektu ili zahtjevima nadzornog inženjera u pogledu uzdužnih i poprečnih nagiba i zadovoljavajućih ravnosti.

Široki iskop

Tijekom izvođenja radova u širokom iskopu izvođač je dužan obavljati(osigurati):

- da se svi iskopi izvedu prema predviđenim visinskim kotama i propisanim nagibima kosina iz projekta, odnosno po zahtjevima nadzornog inženjera
- paziti da tijekom rada na iskopu ne dođe do potkopavanja ili oštećenja projektom predviđenih pokosa uslijed čega bi moglo doći do klizanja i odrona
- za vrijeme rada na iskopu pa do završetka svih radova na objektu, izvođač je dužan osigurati pravilnu odvodnju i time spriječiti oštećenja izrađenih pokosa i njihov stabilitet
- da se iskop do predviđene kote planuma posteljice smije obaviti samo ako materijal nije osjetljiv na utjecaj atmosferilija. Ako jest, tada iskop treba obaviti 0,2-0,3 m iznad kote planuma, a konačni iskop obaviti neposredno prije izrade posteljice i kolničke konstrukcije
- kontrolu nagiba radnih pokosa da se kreću u granicama 1:1 za nevezana krupnozrnata tla, do 1:3 za sitnozrnata vezana koherentna tla

Iskop stepenica

Ako je na trasi potrebno raditi stepenice, treba ih izvoditi na svim nagibima većim od 20 % da bi se osiguralo stabilno nalijeganje nasipa na temeljno tlo. Stepenice mogu biti široke 2,00-5,00 m, nagnute u smjeru nizbrdo 4 %, kosine zasjeka od 2:1 do 3:1, što ovisi o vrsti i svojstvima tla i nagibu terena. Na kamenim terenima gdje ima neravnina koje sprečavaju klizanje tijela nasipa, stepenice se ne moraju izvoditi. Temeljno tlo na stepenicama mora imati traženu zbijenost, ovisno o vrsti i visinskom položaju.

Iskop odvodnih jaraka

Na mjestima gdje su projektirani odvodni jarci potrebno je kontrolirati ravnost dna i bočnih strana jaraka te projektirane padove.

Prijevoz materijala

Ako na trasi postoje značajne količine viška materijala u iskopu, izvođač je dužan osigurati prijevoz viška materijala do nasipa ili odlagališta, te uskladiti način i kapacitet prijevoza sa načinom i kapacitetom iskopa (utovara).

Uređenje temeljnog tla mehaničkim zbijanjem

Dubina uređenja temeljnog tla iznosi do 30 cm. Tlo je potrebno urediti da bi bilo sposobno bez štetnih posljedica preuzeti opterećenja nasipa, kolničke konstrukcije i prometnog opterećenja.

Temeljno tlo se prije zbijanja postupcima vlaženja, rahljenja i sušenja mora dovesti u stanje optimalne vlažnosti po standardnom Proctorovu postupku (HRN U.B1038). Veliku pažnju treba posvetiti očuvanju temeljnog tla od prekomjernog vlaženja, te za vrijeme građenja mora biti osigurana odvodnja temeljnog tla.

Propisi na temelju kojih se kontrolira kakvoća materijala u temeljnom tlu prema hrvatskim normama (HRN): U.B1.010/79, U.B1.012/79, U.B1.014/68, U.B1.016/68, U.B1.018/80, U.B1.020/80, U.B1.024/68, U.B1.038/68, U.B1.046/68, U.E1.010/81.

Tekućim i kontrolnim ispitivanjima obuhvatiti određivanje stupnja zbijenosti u odnosu na standardni Proctorov postupak (Sz) ili određivanje modula stišljivosti (Ms) kružnom pločom Ø 30 cm najmanje na svakih 1000 m^2 uređenog temeljnog tla.

Uređenje slabo nosivog temeljnog tla i posteljice geotekstilom

Način djelovanja geotekstila u područjima primjene u zemljanim radovima i temeljnom tlu može se utvrditi njihovom funkcijom. Ovdje su mjerodavne slijedeće mehaničke i hidrauličke zadaće: 1. razdvajanje, 2. pojačavanje, 3. filtriranje i 4. dreniranje. Ove se zadaće pojavljuju kao kombinacija različitih pojedinačnih funkcija.

Geotekstili sprječavaju svojom funkcijom razdjeljivanja miješanje dvaju materijala bitno različitih svojstava. Na taj se način zadržava cjelovitost i funkcija obaju slojeva, pri čemu debljina pojedinog sloja ostaje nepromijenjena. Pojačanjem se povećava nosivost konstrukcije. Filtriranje i dreniranje omogućuju pravilnu odvodnju s tla, pa se povećava posmična otpornost. Svaki geotekstil primijenjen u zemljanim radovima i temeljnom tlu mora bez obzira na svoju funkciju izdržati uvjete ugradnje. Pri ugradnji pojavljuju se dinamička i statička naprezanja na proboj, pucanje i razvlačenje koji se simulira sljedećim ispitivanjima: 1. ispitivanje statičkim probijanjem – ovim se postupkom simulira opterećenje geotekstila pri navoženju i zbijanju grubog zrnatog nasipnog materijala, 2. vlačno ispitivanje – odnos sile i istezanja opisan je postupkom vlačnog istezanja; pri tome određena maksimalna vlačna sila i istezanje jesu mjerodavne značajke materijala za funkciju pojačanja, 3. ispitivanje dinamičkim probijanjem – ovim se postupkom simulira zatrpavanje geotekstila grubim, oštrim nasipnim materijalom, 4. dinamičko ispitivanje proboja piramidom – promjenjiva naprezanja kojima je izložen geotekstil pri zbijanju i ponovljenim navoženjem (naročito kod malih nasipnih debljina) simuliraju se postupkom dinamičkog proboja piramidom.

Za postavljanje mehaničkih zahtjeva za geotekstil namijenjen stabilizaciji prirodnog tla mjerodavni su sljedeći parametri: 1. vrsta tla, 2. nasipni materijal, 3. prometno opterećenje.

Prije ugradnje geotekstila grube neravnine tla treba izravnati. Geotekstil se polaže na ravnu, odgovarajuće pripremljenu površinu. Spojevi se izvode preklapanjem, zavarivanjem ili šivanjem, pri čemu treba uzeti u obzir odgovarajuće naputke proizvođača.

Preklapanje ovisi o kutu trenja geotekstila, a time i o hrapavosti površine. Najmanje/minimalne duljine preklapanja iznose 50cm za netkane i 80 cm za tkane geotekstile. Da se spriječi klizanje geotekstila na mjestu preklapanja pri nasipanju, preklapanje se izvodi u smjeru nasipanja materijala.

Pri zavarivanju geotekstila površine koje treba zavariti se zagriju širokim plinskim plamenikom ili vrućim zrakom. Odmah nakon toga preklopi se mjesto vara odrolanim geotekstilom i hodanjem se pritisne jedan smotak na drugi. Zavarivanje se smije izvoditi samo ako je geotekstil suh.

Prvi nasipni sloj se na geotekstil nanosi s čela jer treba izbjegavati vožnju kamionom po geotekstilu. Debljina prvog nasipnog sloja na slabo nosivim tlima (modul deformacije $E_{V1} < 7{,}5$ MN/m^2, odnosno modul stišljivosti $M_s < 15$ MN/m^2) u zbijenom stanju treba iznositi barem trostruku veličinu najvećega zrna, odnosno najmanje 30 cm. Način zbijanja (statičko, dinamičko) se odabire ovisno o temeljnom tlu i nasipnom materijalu. Traženu debljinu sloja treba postići na čitavoj širini. Prema potrebi, udubljenja (kolotrazi) treba ispuniti materijalom, a sloj nasipa po cijeloj širini ponovo sabiti.

Uređenje slabog temeljnog tla primjenom polimernih geomreža

Rad obuhvaća sve aktivnosti potrebne za osposobljavanje slabo nosivog ili suviše vlažnog temeljnog tla za izradu nasipa iznad njega. Te aktivnosti uključuju odstranjivanje slabog temeljnog tla, ako je potrebno zbog male visine nasipa, polaganje polimernih geomreža i izradu nasutog sloja od zrnatog kamenog materijala iznad polimernih geomreža. Planum tog nasutog sloja smatra se temeljnim tlom na kome se može raditi nasip, a može se smatrati i posteljicom ako zadovoljava tražene kriterije ocjenjivanja kakvoće.

Ovakav način uređenja slabo nosivog ili suviše vlažnog temeljnog tla primjenjuje se zbog svojstava ili stanja vlažnosti tla, uz odgovarajući način rada, ne mogu postići zahtjevi iz Tablice 1., a služi da bi se omogućila izrada nasipa prema kriterijima za nasipe, odnosno posteljicu.

Pri uređenju temeljnog tla mogu se primijeniti polimerne geomreže tipova A, B, C, D, E, F i G, a i ostale vrste geomreža ako ispunjavaju tehnička svojstva navedena u Tablici 2.

Osim osnovnih tehničkih svojstava iz Tablice 2., polimerne geomreže koje se primjenjuju u cestogradnji moraju imati i ova povoljna svojstva: 1. otpornost na kemijske i bakteriološke utjecaje, 2. otpornost na štetno djelovanje smrzavice, 3. postojanost na ultraljubičastu svjetlost (sunčeve zrake) i 4. otpornost protiv djelovanja životinja (Štetočina).

Izvođač je dužan pribaviti odgovarajuće tehničke podatke o polimernim geomrežama od proizvođača s navedenim područjima primjene, načinom uporabe i načinom utvrđivanja kakvoće. Primjenu određene vrste polimernih geomreža mora odobriti nadzorni inženjer nakon što mu je izvođač predao u originalu dokaz o uporabljivosti.

Za izradu nasipnog sloja ili posteljice, iznad geomreža mogu se primijeniti miješani ili kameni materijali prema uvjetima iz Tablica 4. i 5.

Polimerne se geomreže dobavljaju u rolama, a razastiru se na pripremljeno tlo u uzdužnom smjeru. Treba ih položiti tako da budu dobro i jednoliko napete u uzdužnom i poprečnom smjeru, tj. ne smije doći do većih boranja. Zbog toga se rubovi polimernih mreža moraju učvrstiti željeznim ili drvenim klinovima na razmacima po dva metra.

Uzdužne i poprečne nastavke polimernih geomreža treba spojiti i učvrstiti željeznim spojnicama Ø 5-8 mm u obliku slova „U" na razmacima od po dva metra. Ako se uzdužni i poprečni nastavci ne spajaju, treba izvesti preklop od 20 do 30 cm.

Polimerne se geomreže ne smiju polagati na smrznuto tlo niti za vrijeme dok pada kiša. Rad treba organizirati tako da se položi samo tolika površina polimernih geomreža koja će se istog dana prekriti nasipnim slojem. Na razastrte polimerne geomreže nanose se i razastire nasipni materijal.

Izrada nasipa

Nasipni materijal nanosi se na uređeno temeljno tlo ili na već izrađeni sloj nasipa. Svaki sloj nasipa mora biti razastrt u uzdužnom smjeru ili nagibu koji je najviše jednak projektiranom uzdužnom nagibu nivelete. U poprečnom smjeru nasip uvijek mora imati minimalni poprečni pad u svim fazama izrade. Nasipni materijal treba navoziti po već djelomično zbijenom nasipu, po mogućnosti uvijek po novom tragu tako da se navoženjem omogući jednolično zbijanje slojeva nasipa. S nasipanjem novog sloja može se otpočeti tek kada je prethodni sloj dovoljno zbijen. Visina sloja nasipnog materijala ovisi o vrsti nasipnog materijala i o dubinskom učinku strojeva za zbijanje. Nasipni materijal ne smije se ugrađivati u smrznutom stanju niti na smrznutu podlogu tj. kada na trasi ima snijega i leda. Po završetku nasipa dotjeruju se i planiraju njegovi pokosi.

Dimenzije nasipa moraju se tijekom rada kontrolirati i uspoređivati sa dimenzijama iz projekta mjerenjem od osiguranih iskolčenih točaka osovine ceste. Ako se ustanovi veći nagib pokosa nasipa od projektiranog, potrebno je ispraviti pokos nasipa pomoću izrade stepenica. Nije dopušteno smanjenje pokosa nasipa «naljepljivanjem» sloja materijala bez zbijanja i izrade stepenica.

c) Izrada posteljice od kamenitih materijala

Uređenje posteljice kamenitim materijalom obuhvaća poravnanje preostalih vrhova stijena, nasipavanje i razastiranje izravnavajućeg sloja od čistog sitnijeg kamena, njegovo planiranje i zbijanje do potrebne zbijenosti. U nasipima završni sloj treba izravnati sitnijim kamenim materijalom.

Materijal za izradu posteljice od miješanih materijala treba zadovoljavati ove kriterije:

- koeficijent nejednolikosti $U = \frac{d_{60}}{d_{10}}$ mora biti veći od 9,
- maksimalna veličina zrna je 60 mm (dopušta se da 10% zrna bude veličina do 70 mm),
- radovi na posteljici ne smiju se obavljati kada je tlo smrznuto, odnosno kada na trasi ima snijega i leda,

Kriteriji za ocjenu kakvoće posteljice od miješanih materijala jesu ovi:

- stupanj zbijenosti prema standardnom Proctorovu postupku **Sz** ≥ 100%,
- modul stišljivosti mjeren kružnom pločom ∅ 30 cm **Ms** ≥ 40 MN/m^2 .

KOLNIČKA KONSTRUKCIJA

Projektirana šumska cesta „Rimska cesta – dionica I" prema važećim kriterijima podjele šumskih cesta u Republici Hrvatskoj (Šikić i dr., 1989.: Tehnički uvjeti za gospodarske ceste i Anon., 2015.: Tehničke značajke šumskih prometnica (primarnih i sekundarnih) (NN 106/2015)) se ubraja u: 1. kategoriju prilaznih šumskih cesta prema kriteriju značenja, 2. kategoriju šumskih cesta s neznatnim/lakim prometnim opterećenjem (ispod 100, odnosno do 500 bruto tona/dan) sukladno kriteriju prometnog opterećenja, 3. kategoriju šumskih cesta III. Reda temeljem kriterija veličine i učestalosti transporta drvne mase i 4. kategoriju brežuljkastih šumskih cesta na osnovu kriterija kategorije terena/reljefa.

Planirani promet na projektiranoj cesti je povremenog karaktera za teška vozila sa većim specifičnim pritiscima kotača. Za takve uvijete su pogodnije kolničke konstrukcije koje se sastoje od nevezanog zrnatog kamenog materijala, i koje ne pokazuju značajnije promjene i nastala oštećenja, a koja se mogu relativno lako i ekonomično otkloniti. Teren kroz koji prolazi trasa je brežuljkast sa nagibima nivelete od minimalnih 0,08 % do maksimalnih 6,26 %. Cesta je namijenjena dvosmjernom prometu sa jednom voznom trakom širine kolnika 3,0 m.

Kolnička konstrukcija dimenzionirana je za lakše (povremeno) prometno opterećenje na neograničen vremenski period ali uz potrebno redovito održavanje i popravljanje prometnice.

Kao materijal za izradu kolničke konstrukcije od nevezanog zrnatog kamenog materijala mogu se koristiti:

- prirodni šljunak
- drobljeni kameni materijal
- lokalni zrnati materijali

Ovi materijali moraju zadovoljavati određene zahtjeve u pogledu:

- fizičko-mehaničkih i mineraloško-petrografskih svojstava samih zrna
- granulometrijskog sastava ukupnog materijala
- sadržaja organskih tvari i lakih čestica
- nosivosti

Zahtjevi u pogledu fizičko-mehaničkih svojstava su sljedeći:

- oblik zrna, zrna nepovoljnog oblika (3:1) - max 40 %
- upijanje vode (HRN B.B8.031) - max 1,6 %
- otpornost na habanje po metodi Los Angeles - max 45 %

Granulometrijski sastav upotrebljenih materijala mora zadovoljavati slijedeće uvijete:

- udio zrna manjih od 0,02 mm ne smije biti veći od 3 mas. %
- koeficijent nejednakosti $U = d_{60}/d_{10}$ mora se kretati u granicama U = 15 – 100 (za šljunak), odnosno U = 15 – 50 (za drobljeni kameni materijal)
- na granulaciju lokalnih zrnatih materijala ne postavljaju se posebni zahtjevi, ali se traži da materijali imaju sposobnost da se mehaničkim sredstvima mogu dobro učvrstiti i zbiti, a veličina najvećeg zrna ograničena je na ½ predviđene debljine sloja.

Upotrebljeni materijali ne smiju sadržavati više od 5 % organskih tvari i lakih čestica.

Zbijenost sloja kolničke konstrukcije mora biti takva da kamioni prilikom prometovanja ne ostavljaju nikakve tragove. Za mjerenje zbijenosti primjenjuje se postupak ispitivanja pomoću čelične kružne ploče Ø 30 cm pri čemu modul stišljivosti mora biti najmanje Ms = 50 MN/m^2.

Ravnost površine mjeri se letvom dužine 4 m, a odstupanje smije biti najviše 2 cm. Odstupanje od projektiranog poprečnog nagiba smije biti najviše ± 0,5 %. Odstupanje debljine sloja od predviđene debljine u zbijenom stanju (srednja vrijednost) ne smije biti veće od 10 %. Neovisno o tome pojedinačne vrijednosti ne smiju biti za više od 15 % manje od predviđene debljine sloja.

Uzimajući u obzir značaj ceste, intenzitet i vrstu prometa kao i ostale zahtjeve, određeno je ukupno prometno opterećenje, a na temelju kojeg je izvršeno dimenzioniranje kolničke konstrukcije.

9. Tehnički opis trase šumske ceste

d) Odvodnja

Odvodnja trupa ceste predviđena je izradom trapeznih putnih jaraka projektiranog profila dubine 50 cm, širine dna 50 cm i nagiba stijena 1:1. Niveletu putnih jaraka treba izraditi kako je predviđeno crtanim prilozima uzdužnih i poprečnih profila, položaju recipijenta i potrebi što efikasnijeg prikupljanja i odvođenja oborinskih voda sa kolnika i okolnog terena.

Na projektiranoj prometnici u svrhu poprečne odvodnje predviđena je ugradnja 7 cijevnih propusta vanjskog promjera 630 mm od plastične rebraste PEHD cijevi, a čije su lokacije i dimenzije vidljive u prilozima ovog projekta: situacija, crtani uzdužni i poprečni profil.

Lokacija i broj od 12 pojedinačnih cijevnih propusta vanjskog promjera 630 mm, predviđenih za spoj privatnih šumskih i poljoprivrednih parcela preko projektiranih uzdužnih odvodnih jaraka, dana je orijentaciono, a točnu lokaciju i broj odredit će nadzorni inženjer tijekom gradnje u dogovoru sa šumoposjednicima i poljoprivrednicima.

Cijevne propuste za poprečnu odvodnju na predmetnoj prometnici potrebno je izvesti sa osiguranjem podloge i ulazno - izlaznih glava.

Ako se tokom izvođenja radova ukaže potreba za dodatnom odvodnjom lokaciju odvodnih jaraka i cijevnih propusta odredit će nadzorni organ.

Cijevne propuste i odvodne jarke potrebno je nakon gradnje redovito ili povremeno po potrebi održavati i čistiti od nanosa, osulina, naplavina, i sl., kako bi trajno zadržali svoju funkcionalnost i očuvali postojanost projektirane prometnice.

Svi naknadni radovi, koji nisu obuhvaćeni ovim projektom mogu se izvoditi samo uz suglasnost investitora i nadzornog inženjera.

Šumska cesta "RIMSKA CESTA – DIONICA I"

1. Postojeće stanje

Glavni projekt šumske ceste "Rimska cesta – dionica I", kojim se postojeći traktorski put rekonstruira u šumsku cestu, izrađen je na temelju projektnog zadatka definiranog od strane investitora – Općine Hrvatska Dubica.

Trasa je postojeći traktorski put koji povezuje asfaltnu nerazvrstanu cestu iz predjela Kamenik, preko predjela Šicane i nerazvrstanu asfaltnu cestu u naselju Baćin.

2. Tehnički podaci

a) Smjer i položaj trase

Šumska cesta "Rimska cesta - dionica" proteže se katastarskim česticama koje su ucrtane u katastar kao put, te susjednim česticama gdje je to potrebno radi ukupne širine zahvata. Ova trasa je ucrtana i na preglednu kartu.

Projektirana dionica predmetne ceste proteže se slabo korištenim i neodržavanim postojećim traktorskim putem kroz šumski kompleks državnih i privatnih šuma do naselja Baćin.

Dužina trase iznosi **3395,45 m**.

b) Donji stroj

Prema snimljenim i obrađenim terenskim podacima sačinjen je crtani uzdužni profil, položena niveleta planuma i poprečni profili, tako da se što bolje izjednače mase iskopa i nasipa, da se udaljenosti transporta materijala između iskopa, nasipa, deponija i pozajmišta svedu na optimalne dužine, a da budu zadovoljeni tehnički normativi. Prije izvođenja radova potrebno je u području izvođenja radova, sve panjeve izvaditi i odstraniti, te ih deponirati izvan područja zemljanih radova, a veće kolotrage ispunjene vodom potrebno je ispustima isušiti.

Nagib nivelete kreće se od minimalno 0,08 % do maksimalne vrijednosti 6,26 %, projektirane su vertikalne krivine sa rasponom radiusa od minimalno R = 400 metra do maksimalno R = 2000 metra da se ublaže vertikalni lomovi nivelete i osigura preglednost prema tehničkim normativima.

Pokosi zasjeka i usjeka projektirani su sa nagibom 1:1, a pokosi nasipa sa nagibom 1 :1,5. Donji stroj je projektiran sa širinom planuma 4,00 metara na pravcima dok su u

krivinama projektom predviđena proširenja za sve radijuse R<100 metara prema tehničkim normativima. Iskop iz jaraka potrebno je rasplanirati u planumu.

Planum je potrebno dobro uvaljati kako bi mogao preuzeti opterećenja kolničke konstrukcije i prometa.

Kako je ovo uglavnom brežuljkasta trasa, a tehnologija izvođenja klasična sa stabilizacijom tla geotekstilom i geomrežom, maksimalno smo se prilagodili postojećem stanju terena u uzdužnom smislu..

Nakon uređenja planuma posteljica se planira buldozerom u poprečnom nagibu od 3,0, što je vidljivo u poprečnom profilu. Nasip i posteljica se valjaju statičkim valjkom do potpune zbijenosti poštujući kote iz projekta.

c) Gornji stroj

Projektirani gornji ustroj je kolovoz tipa McAdam, a njegova izgradnja predviđa se u dva sloja. Izgradnja nosivog sloja gornjeg ustroja predviđa se od kamena tucanika krupnoće 30 – 90 mm i debljine sloja 30 cm (2 x 15 cm), a izgradnja završnog sloja gornjeg ustroja predviđa se od kamena tucanika krupnoće 0 – 32 mm, i debljine sloja 5 cm u sabitom stanju. Prvi dio nosivog sloja nije potrebno sabiti u potpunosti radi lakšeg vezanja sa drugim (gornjim) dijelom istog sloja. Projektom je predviđena širina kolovoza 3,0 m i širina bankina 0,5 m.

Na cijeloj dionici projektirane trase u svrhu poboljšanja nosivosti posteljice i temeljnog tla predviđena je ugradnja geokompozita (kombinacija geotekstila i geomreže) na izgrađenu i dobro uvaljanu posteljicu. Preporuča se ručno postavljanje geokompozita koji moraju imati minimalnu širinu koliko je širina gornjeg ustroja (tampona) u bazi, a prilikom ugradnje treba voditi brigu da se ugradnja geokompozita organizira na dnevnoj bazi kako bi se negativan utjecaj UV-zraka na geotekstil sveo na minimum.

Poprečni nagib kolovoza je jednostrešan od 3% na pravcima i krivinama prema objektima za odvodnju ovisno o radiusu krivina.
